

Logic

Chapter 3

MATH 280 Discrete Mathematical Structures

Proposition

- ▶ A *proposition* is a sentence that is one of either *true* or *false*
 - ▶ A proposition is also known as a *statement*
- ▶ Possible propositions:
 - ▶ The wall is tan.
 - ▶ $5 < 10$
 - ▶ Tennessee is a state.
 - ▶ Animals live beneath the surface of Mars.
- ▶ Non-propositions:
 - ▶ The painting is beautiful.
 - ▶ When is Christmas?
 - ▶ He is tall. Who?
 - ▶ $x < 10$ $x = ?$
- ▶ We can use variables such as p , q , and r to represent propositions
 - ▶ p might represent “ $5 < 10$ ”

Truth Tables

- ▶ We can construct compound propositions from simpler propositions using logical operators
- ▶ The common logical operators include *and*, *or*, and *not*
- ▶ A *truth table* shows the possible range of true values for a compound proposition
 - ▶ 0 represents false
 - ▶ 1 represents true

p	q	$f(p, q)$
0	0	0
0	1	1
1	0	0
1	1	1

Conjunction

- ▶ Logical *and*

p	q	$p \wedge q$
0	0	0
0	1	0
1	0	0
1	1	1

- ▶ The only way to obtain a 1 (true) is if both operands are true
- ▶ Mathematics: $a \wedge b$
Digital logic: ab
C++: $a \ \&\& \ b$
Python: $a \ \text{and} \ b$

Disjunction

- ▶ Logical *or*

p	q	$p \vee q$
0	0	0
0	1	1
1	0	1
1	1	1

- ▶ The only way to obtain a 0 (false) is if both operands are false
- ▶ Mathematics: $a \vee b$
Digital logic: $a + b$
C++: $a \ || \ b$
Python: $a \ \text{or} \ b$

Negation

- ▶ Logical *not*

p	$\neg p$
0	1
1	0

- ▶ Negation is a unary operator and so requires only one operand
- ▶ Mathematics: $\neg a$ $\sim a$ a'
Digital logic: \bar{a}
C++: $!a$
Python: $\text{not} \ a$

Conditional Operator

► Logical *if ... then*, or *implies*

p	q	$p \rightarrow q$
0	0	1
0	1	1
1	0	0
1	1	1

- p is the antecedent, and q is consequent
- Example: If it is raining, the grass is wet
 - If it raining and the grass is wet, the statement is a true statement
 - If is raining but the grass is not wet, the statement is not true
 - If it is not raining and the grass is not wet, the statement cannot be false; it only makes a claim about when it is raining
 - The most interesting case: If it is not raining and the grass is wet, the statement cannot be false; it only makes a claim about when it is raining. If it is not raining, the grass could be wet for other reasons, such as a sprinkler system or dew.

Converse

- The converse of $p \rightarrow q$ is $q \rightarrow p$
- These two propositions are **not** logically equivalent
- Given the propositions $r =$ “it is raining” and $w =$ “the grass is wet”, if the compound proposition $r \rightarrow w$ is true, we cannot conclude that its converse ($w \rightarrow r$) also is true.
 - The grass could be wet due to sprinklers
- A logical fallacy: *affirming the consequent*

Biconditional Operator

► if and only if (iff)

p	q	$p \leftrightarrow q$
0	0	1
0	1	0
1	0	0
1	1	1

- Short for $(p \rightarrow q) \wedge (q \rightarrow p)$
- Represents logical equivalence

English Equivalents

$p \rightarrow q$	$p \leftrightarrow q$
if p , then q	p if and only if q
p implies q	p is necessary and sufficient for q
q follows from p	p is equivalent to q
q , if p	if p , then q , and if q , then p
p , only if q	if p , then q and conversely
p is sufficient for q	
q is necessary for p	

Compound Propositions

- If p and q are propositions (e.g., $p =$ “The tree is tall”, $q =$ “The lake is deep”)
 - $p \wedge q$ is a proposition “The tree is tall and the lake is deep.”
 - $p \vee q$ is a proposition “The tree is tall or the lake is deep.”
 - $\neg p$ is a proposition “The tree is not tall.” (or “The tree is short.”)
 - (p) is a proposition (use parentheses for grouping)
- This applies recursively: $(p \wedge q) \vee \neg p$ is a proposition
- Generally understood precedence rules: negation first, conjunction second, disjunction third
 - $p \wedge q \vee r$ is equivalent to $(p \wedge q) \vee r$
 - $\neg p \wedge q$ is equivalent to $(\neg p) \wedge q$
- What about \rightarrow and \leftrightarrow ?

Truth Table for Compound Proposition

► $\neg p \vee q$

p	q	$\neg p$		
0	0			
0	1			
1	0			
1	1			

Truth Table for Compound Proposition

► $\neg p \vee q$

p	q	$\neg p$		
0	0	1		
0	1	1		
1	0	0		
1	1	0		

Truth Table for Compound Proposition

► $\neg p \vee q$

p	q	$\neg p$	$\neg p \vee q$	
0	0	1		
0	1	1		
1	0	0		
1	1	0		

Truth Table for Compound Proposition

► $\neg p \vee q$

p	q	$\neg p$	$\neg p \vee q$	
0	0	1	1	
0	1	1	1	
1	0	0	0	
1	1	0	1	

Truth Table for Compound Proposition

► $\neg p \vee q$

p	q	$\neg p$	$\neg p \vee q$	$p \rightarrow q$
0	0	1	1	1
0	1	1	1	1
1	0	0	0	0
1	1	0	1	1

Truth Table for Compound Proposition

► $\neg p \vee q$

p	q	$\neg p$	$\neg p \vee q$	$p \rightarrow q$
0	0	1	1	1
0	1	1	1	1
1	0	0	0	0
1	1	0	1	1

The propositions $\neg p \vee q$ and $p \rightarrow q$ are equivalent

Truth Table for Compound Proposition

► Construct a truth table for $(p \wedge q) \vee (\neg q \wedge r)$

p	q	r	$p \wedge q$	$\neg q$	$\neg q \wedge r$	$(p \wedge q) \vee (\neg q \wedge r)$
0	0	0				
0	0	1				
0	1	0				
0	1	1				
1	0	0				
1	0	1				
1	1	0				
1	1	1				

Truth Table for Compound Proposition

► Construct a truth table for $(p \wedge q) \vee (\neg q \wedge r)$

p	q	r	$p \wedge q$	$\neg q$	$\neg q \wedge r$	$(p \wedge q) \vee (\neg q \wedge r)$
0	0	0	0			
0	0	1	0			
0	1	0	0			
0	1	1	0			
1	0	0	0			
1	0	1	0			
1	1	0	1			
1	1	1	1			

Truth Table for Compound Proposition

► Construct a truth table for $(p \wedge q) \vee (\neg q \wedge r)$

p	q	r	$p \wedge q$	$\neg q$	$\neg q \wedge r$	$(p \wedge q) \vee (\neg q \wedge r)$
0	0	0	0	1		
0	0	1	0	1		
0	1	0	0	0		
0	1	1	0	0		
1	0	0	0	1		
1	0	1	0	1		
1	1	0	1	0		
1	1	1	1	0		

Truth Table for Compound Proposition

► Construct a truth table for $(p \wedge q) \vee (\neg q \wedge r)$

p	q	r	$p \wedge q$	$\neg q$	$\neg q \wedge r$	$(p \wedge q) \vee (\neg q \wedge r)$
0	0	0	0	1	0	
0	0	1	0	1	1	
0	1	0	0	0	0	
0	1	1	0	0	0	
1	0	0	0	1	0	
1	0	1	0	1	1	
1	1	0	1	0	0	
1	1	1	1	0	0	

Truth Table for Compound Proposition

► Construct a truth table for $(p \wedge q) \vee (\neg q \wedge r)$

p	q	r	$p \wedge q$	$\neg q$	$\neg q \wedge r$	$(p \wedge q) \vee (\neg q \wedge r)$
0	0	0	0	1	0	0
0	0	1	0	1	1	1
0	1	0	0	0	0	0
0	1	1	0	0	0	0
1	0	0	0	1	0	0
1	0	1	0	1	1	1
1	1	0	1	0	0	1
1	1	1	1	0	0	1

Logial Equivalence

► Recall that $\neg p \vee q$ and $p \rightarrow q$ are equivalent propositions

p	q	$\neg p \vee q$	$p \rightarrow q$	$(\neg p \vee q) \leftrightarrow (p \rightarrow q)$
0	0	1	1	
0	1	1	1	
1	0	0	0	
1	1	1	1	

Logial Equivalence

► Recall that $\neg p \vee q$ and $p \rightarrow q$ are equivalent propositions

p	q	$\neg p \vee q$	$p \rightarrow q$	$(\neg p \vee q) \leftrightarrow (p \rightarrow q)$
0	0	1	1	1
0	1	1	1	1
1	0	0	0	1
1	1	1	1	1

Logial Equivalence

► Recall that $\neg p \vee q$ and $p \rightarrow q$ are equivalent propositions

p	q	$\neg p \vee q$	$p \rightarrow q$	$(\neg p \vee q) \leftrightarrow (p \rightarrow q)$
0	0	1	1	1
0	1	1	1	1
1	0	0	0	1
1	1	1	1	1

- A proposition that always is true regardless of the truth values of its variables is called a *tautology*
A column consisting of all 1s represents a tautology
- If $p \leftrightarrow q$ is a tautology, p and q are equivalent propositions
- $p \leftrightarrow q$ indicates that p and q represent equivalent propositions (i.e., $p \leftrightarrow q$ is a tautology)

Negating a Conjunction

- $\neg(p \wedge q) \Leftrightarrow \neg p \vee \neg q$?
- p = “I am tall” q = “I am smart”
- $\neg(p \wedge q)$ represents “I am not both tall and smart”
- $\neg p \vee \neg q$ represents “I am not tall or I am not smart”
- The propositions will be true for some people and false for others, but both expressions will have the *same truth value* for the *same person*
- You can prove it with a truth table

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0						
0	1						
1	0						
1	1						

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0	0					
0	1	0					
1	0	0					
1	1	1					

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0	0	1				
0	1	0	1				
1	0	0	1				
1	1	1	0				

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0	0	1	1			
0	1	0	1	1			
1	0	0	1	0			
1	1	1	0	0			

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0	0	1	1	1		
0	1	0	1	1	0		
1	0	0	1	0	1		
1	1	1	0	0	0		

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0	0	1	1	1	1	
0	1	0	1	1	0	1	
1	0	0	1	0	1	1	
1	1	1	0	0	0	0	

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0	0	1	1	1	1	1
0	1	0	1	1	0	1	1
1	0	0	1	0	1	1	1
1	1	1	0	0	0	0	1

Negating a Conjunction

p	q	$p \wedge q$	$\neg(p \wedge q)$	$\neg p$	$\neg q$	$\neg p \vee \neg q$	$\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$
0	0	0	1	1	1	1	1
0	1	0	1	1	0	1	1
1	0	0	1	0	1	1	1
1	1	1	0	0	0	0	1

Contradiction

$p \wedge (\neg p \vee q) \wedge \neg q$

p	q	$\neg p$	$\neg p \vee q$	$p \wedge (\neg p \vee q)$	$\neg q$	$p \wedge (\neg p \vee q) \wedge \neg q$
0	0					
0	1					
1	0					
1	1					

Contradiction

$p \wedge (\neg p \vee q) \wedge \neg q$

p	q	$\neg p$	$\neg p \vee q$	$p \wedge (\neg p \vee q)$	$\neg q$	$p \wedge (\neg p \vee q) \wedge \neg q$
0	0	1				
0	1	1				
1	0	0				
1	1	0				

► The tautology proves $\neg(p \wedge q) \leftrightarrow \neg p \vee \neg q$

Contradiction

$p \wedge (\neg p \vee q) \wedge \neg q$

p	q	$\neg p$	$\neg p \vee q$	$p \wedge (\neg p \vee q)$	$\neg q$	$p \wedge (\neg p \vee q) \wedge \neg q$
0	0	1	1			
0	1	1	1			
1	0	0	0			
1	1	0	1			

Contradiction

$p \wedge (\neg p \vee q) \wedge \neg q$

p	q	$\neg p$	$\neg p \vee q$	$p \wedge (\neg p \vee q)$	$\neg q$	$p \wedge (\neg p \vee q) \wedge \neg q$
0	0	1	1	0		
0	1	1	1	0		
1	0	0	0	0		
1	1	0	1	1		

Contradiction

$p \wedge (\neg p \vee q) \wedge \neg q$

p	q	$\neg p$	$\neg p \vee q$	$p \wedge (\neg p \vee q)$	$\neg q$	$p \wedge (\neg p \vee q) \wedge \neg q$
0	0	1	1	0	1	
0	1	1	1	0	0	
1	0	0	0	0	1	
1	1	0	1	1	0	

Contradiction

$p \wedge (\neg p \vee q) \wedge \neg q$

p	q	$\neg p$	$\neg p \vee q$	$p \wedge (\neg p \vee q)$	$\neg q$	$p \wedge (\neg p \vee q) \wedge \neg q$
0	0	1	1	0	1	0
0	1	1	1	0	0	0
1	0	0	0	0	1	0
1	1	0	1	1	0	0

- ▶ A column of all 0s represents a *contradiction*

Tautologies and Contradictions

- ▶ A proposition that is always true is a *tautology*
 - ▶ $p \vee \neg p$ is always true regardless of the truth value of p
 - ▶ We represent a tautology as 1
- ▶ A proposition that can never be true under any circumstances is a *contradiction*
 - ▶ $p \wedge \neg p$ is always false regardless of the truth value of p
 - ▶ We represent a contradiction as 0
- ▶ A proposition that can be either true or false is a *contingency*
 - ▶ $p \rightarrow q$ is false if p is true and q is false; otherwise, it is true

Truth Table Facts

- ▶ A truth table with two variables has how many rows? 4
- ▶ A truth table with three variables has how many rows? 8
- ▶ A truth table with four variables has how many rows? 16
- ▶ A truth table with n variables has how many rows? 2^n
- ▶ A truth table with 2 variables can have how many unique columns?

A Full Truth Table

p	q	0	$p \wedge q$	$\neg(p \rightarrow q)$	p	$\neg(q \rightarrow p)$	q	$p \leftrightarrow q$	$p \vee q$	$p \vee q$	$p \vee q$	$p \leftrightarrow q$	$\neg q$	$q \rightarrow p$	$\neg p$	$p \rightarrow q$	$p \leftrightarrow q$	1
0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	1
0	1	0	0	0	0	1	1	1	1	1	1	1	0	0	0	1	1	1
1	0	0	0	1	1	0	0	0	1	1	1	0	1	1	0	0	1	1
1	1	0	1	0	1	0	1	1	1	1	1	1	0	0	0	1	1	1

Fundamental Laws of Logic

Commutative	$p \wedge q \Leftrightarrow q \wedge p$ $p \vee q \Leftrightarrow q \vee p$
Associative	$p \wedge (q \wedge r) \Leftrightarrow (p \wedge q) \wedge r$ $p \vee (q \vee r) \Leftrightarrow (p \vee q) \vee r$
Distributive	$p \wedge (q \vee r) \Leftrightarrow (p \wedge q) \vee (p \wedge r)$ $p \vee (q \wedge r) \Leftrightarrow (p \vee q) \wedge (p \vee r)$
Identity	$p \wedge 1 \Leftrightarrow p$ $p \vee 0 \Leftrightarrow p$
Negation	$p \wedge \neg p \Leftrightarrow 0$ $p \vee \neg p \Leftrightarrow 1$
Idempotence	$p \wedge p \Leftrightarrow p$ $p \vee p \Leftrightarrow p$
Null	$p \wedge 0 \Leftrightarrow 0$ $p \vee 1 \Leftrightarrow 1$
Absorption	$p \wedge (p \vee q) \Leftrightarrow p$ $p \vee (p \wedge q) \Leftrightarrow p$
DeMorgan's	$\neg(p \wedge q) \Leftrightarrow \neg p \vee \neg q$ $\neg(p \vee q) \Leftrightarrow \neg p \wedge \neg q$
Involution	$\neg(\neg p) \Leftrightarrow p$

Inference Rules

- ▶ If $r \rightarrow s$ is a tautology, we say $r \rightarrow s$ is an *inference rule*
- ▶ Your author uses the notation $r \Rightarrow s$ to denote an inference rule
- ▶ Note that unlike an equivalence ($a \Leftrightarrow b$), an inference rule ($a \Rightarrow b$) goes only one direction

Inference Rules

Detachment	$(p \rightarrow q) \wedge p \Rightarrow q$
Indirect reasoning	$(p \rightarrow q) \wedge \neg q \Rightarrow \neg p$
Disjunctive addition	$p \Rightarrow p \vee q$
Conjunction	$p, q \Rightarrow p \wedge q$
Conjunctive simplification	$p \wedge q \Rightarrow p$
Disjunctive simplification	$(p \vee q) \wedge \neg p \Rightarrow q$
Chain rule	$(p \rightarrow q) \wedge (q \rightarrow r) \Rightarrow p \rightarrow r$
Conditional equivalence	$p \rightarrow q \Leftrightarrow \neg p \vee q$
Biconditional equivalence	$p \leftrightarrow q \Leftrightarrow (p \rightarrow q) \wedge (q \rightarrow p)$
Contrapositive	$p \rightarrow q \Leftrightarrow \neg q \rightarrow \neg p$

Mathematical System

- A *mathematical system* consists of
- ▶ a set or universe, U
 - ▶ definitions—sentences that explain the meaning of concepts that relate to the universe
 - ▶ axioms—assertions about the properties of the universe and rules for creating and justifying more assertions
 - ▶ theorems—additional assertions derived from the axioms of the mathematical system

Propositional Calculus

- ▶ The logic we have covered so far is part of propositional calculus
- ▶ A theorem is a true proposition derived from the axioms of the system
- ▶ A theorem proved to be true is an extension of the axioms of the system
- ▶ Theorems are usually expressed as a finite number of premises (propositions) with a conclusion (a proposition)
 $p_1 \wedge p_2 \wedge p_3 \wedge \dots \wedge p_n \Rightarrow C$

<div>Proof</div> <div><ul style="list-style-type: none">▶ Proof of a theorem: a finite sequence of logically valid steps that demonstrate that the premises of a theorem imply its conclusion▶ The form of a proof can vary depending on its intended audience▶ A proof in propositional calculus can be verified mechanically▶ Truth tables are sufficient to prove theorems in propositional calculus, but they often are not convenient</div>	<div>Formal Proof</div> <div><ul style="list-style-type: none">▶ A proof must end in a finite number of steps▶ Each step must be either a premise or a proposition implied from previous steps using a valid equivalence or rule of inference; each step requires explicit justification▶ For a direct proof, the last step must be the conclusion; for an indirect proof the last step must be a contradicion</div>	<div>Direct Proof</div> <div>Theorem: $(p \rightarrow r) \wedge (q \rightarrow s) \wedge (p \vee q) \Rightarrow s \vee r$</div> <div><table><thead><tr><th></th><th>Statement</th><th>Reason</th></tr></thead><tbody><tr><td>1.</td><td>$p \vee q$</td><td>premise</td></tr><tr><td>2.</td><td>$\neg(\neg p) \vee q$</td><td>1, involution</td></tr><tr><td>3.</td><td>$\neg p \rightarrow q$</td><td>2, conditional rule</td></tr><tr><td>4.</td><td>$q \rightarrow s$</td><td>premise</td></tr><tr><td>5.</td><td>$\neg p \rightarrow s$</td><td>3, 4, chain rule</td></tr><tr><td>6.</td><td>$\neg s \rightarrow \neg(\neg p)$</td><td>5, contrapositive</td></tr><tr><td>7.</td><td>$\neg s \rightarrow p$</td><td>6, involution</td></tr><tr><td>8.</td><td>$p \rightarrow r$</td><td>premise</td></tr><tr><td>9.</td><td>$\neg s \rightarrow r$</td><td>7, 8, chain rule</td></tr><tr><td>10.</td><td>$\neg(\neg s) \vee r$</td><td>9, conditional rule</td></tr><tr><td>11.</td><td>$s \vee r$</td><td>10, involution ■</td></tr></tbody></table></div>		Statement	Reason	1.	$p \vee q$	premise	2.	$\neg(\neg p) \vee q$	1, involution	3.	$\neg p \rightarrow q$	2, conditional rule	4.	$q \rightarrow s$	premise	5.	$\neg p \rightarrow s$	3, 4, chain rule	6.	$\neg s \rightarrow \neg(\neg p)$	5, contrapositive	7.	$\neg s \rightarrow p$	6, involution	8.	$p \rightarrow r$	premise	9.	$\neg s \rightarrow r$	7, 8, chain rule	10.	$\neg(\neg s) \vee r$	9, conditional rule	11.	$s \vee r$	10, involution ■

3. p	1, 2, disjunctive simplification
4. $p \rightarrow (q \rightarrow s)$	premise
5. $q \rightarrow s$	3, 4, detachment
6. q	premise
7. s	5, 6, detachment ■

Validity of Verbal Arguments

- ▶ You can check the validity of a verbal argument (sales pitch, political speech, etc.) using the tools we have seen so far, as long as the argument uses simple declarative statements
- ▶ Consider the following announcement made by a government official:
If the interest rates drop, the housing market will improve. Either the federal discount rate will drop or the housing market will not improve. Interest rates will drop; therefore, the federal discount rate will drop.
- ▶ Use the following variables to represent the individual propositions:
 - ▶ r : Interest rates will drop.
 - ▶ h : The housing market will improve.
 - ▶ f : The federal discount rate will drop.to produce $(r \rightarrow h) \wedge (f \vee \neg h) \wedge r \Rightarrow f$

Validity of Verbal Arguments

- ▶ Use the following variables to represent the individual propositions:
 - ▶ r : Interest rates will drop.
 - ▶ h : The housing market will improve.
 - ▶ f : The federal discount rate will drop.
- to produce $(r \rightarrow h) \wedge (f \vee \neg h) \wedge r \Rightarrow f$

Statement	Reason
1. $r \rightarrow h$	premise
2. $f \vee \neg h$	premise
3. r	premise
4. $\neg h \vee f$	2, commutative
5. $h \rightarrow f$	4, conditional equivalence
6. $r \rightarrow f$	1, 5, chain rule
7. f	3, 6, detachment

Proof by Contradiction

- ▶ As known as an *indirect proof*
- ▶ Strategy: Show that the premises coupled with the negation of the conclusion lead to a contradiction
- ▶ The contradiction can appear in various forms:
 - ▶ For proofs involving propositional calculus: a proposition of the form $p \wedge \neg p$
 - ▶ For proofs involving numbers: $0 = 1$ or $0 < 0$
 - ▶ For proofs involving sets: $x \in \emptyset$ or $x \in S \wedge x \in S^C$

Proof by Contradiction Justification

- ▶ Consider a theorem $P \Rightarrow C$, where P represents the premises $p_1 \wedge p_2 \wedge \dots \wedge p_n$
- ▶ $(P \wedge \neg C \rightarrow 0) \rightarrow (P \rightarrow C)$

P	C	$\neg C$	$P \wedge \neg C$	0	$P \wedge \neg C \rightarrow 0$	$P \rightarrow C$	$(P \wedge \neg C \rightarrow 0) \rightarrow (P \rightarrow C)$
0	0	1	0	0	1	1	1
0	1	0	0	0	1	1	1
1	0	1	1	0	0	0	1
1	1	0	0	0	1	1	1

Proof by Contradiction

Theorem: $(p \rightarrow r) \wedge (q \rightarrow s) \wedge (p \vee q) \Rightarrow s \vee r$

Statement	Reason
1. $\neg(s \vee r)$	negated conclusion
2. $\neg s \wedge \neg r$	1, DeMorgan's law
3. $\neg s$	2, conjunctive simplification
4. $q \rightarrow s$	premise

13. 0	12, negation $\rightarrow \leftarrow$ ■

Higher-level Proofs

- ▶ Most mathematicians write proofs at a higher level than the proofs we have seen so far
- ▶ The difference is like the difference between programming in a higher-level language vs. assembly language programming
- ▶ Most proofs consist largely of natural language text (like English) and do not explicitly mention the inference rules involved
- ▶ Prove that the sum of any two odd numbers is even

Background for Proof

- Prove that the sum of any two odd numbers is even
- ▶ We need to establish some definitions and facts that go beyond those we have seen so far:
 - ▶ Only integers may be classified as even or odd
 - ▶ Any even number may be expressed as $2k$, for some integer k . Even numbers are multiples of two.
 - ▶ Any odd number may be expressed as $2k + 1$, for some integer k . Odd numbers are not multiples of two.
 - ▶ The set of integers is closed under addition. This means if you add any two integers the result is guaranteed to be an integer.
 - ▶ The set of integers is closed under multiplication. This means if you multiply any two integers the result is guaranteed to be an integer.
 - ▶ The normal rules of algebra apply.

<h3>The Proof</h3> <p>Prove that the sum of any two odd numbers is even</p> <p>Let m and n be any two odd integers. There exist $k, p \in \mathbb{Z}$ such that $m = 2k + 1$, and $n = 2p + 1$. (Why use two different variables, k and p?)</p> $\begin{aligned} m + n &= (2k + 1) + (2p + 1) \\ &= 2k + 2p + 1 + 1 \\ &= 2k + 2p + 2 \\ &= 2(k + p + 1) \end{aligned}$ <p>$k + p + 1$ is an integer because the set of integers is closed under addition. Thus, the sum of any two odd numbers is an even number. ■</p>	<h3>Proof by Contradiction</h3> <ul style="list-style-type: none">▶ Prove that $\sqrt{2}$ is irrational.▶ Background: An irrational number is a number that may not be represented as the ratio of two integers<ul style="list-style-type: none">▶ Examples include π, e, and $\sqrt{2}$ <p>The product of two even numbers is even, and the product of two odd numbers is odd.</p> <ul style="list-style-type: none">▶ To prove by contradiction, we will assume the conclusion is false and produce a contradiction	<h3>Prove $\sqrt{2}$ is Irrational</h3> <p>Suppose $\sqrt{2}$ is rational. Let $\sqrt{2} = \frac{m}{n}$, where $m, n \in \mathbb{Z}$, and $n \neq 0$.</p> <p>Further, let $\frac{m}{n}$ be a fraction reduced the lowest terms (this means m and n have no common factors except 1). Square both sides of the equation to obtain</p> $2 = \frac{m^2}{n^2}$ <p>Multiplying both sides by n^2 yields</p> $2n^2 = m^2$ <p>Thus, m is an even number, because the product of two odd numbers is odd. Since m is even, we can express it as $m = 2k$, for some integer k.</p>										
<h3>Prove $\sqrt{2}$ is Irrational</h3> <p>Since $m = 2k$, for some integer k, we can rewrite</p> $2n^2 = m^2$ <p>as</p> $2n^2 = (2k)^2$ <p>or</p> $2n^2 = 4k^2$ <p>Dividing both sides by 2 produces</p> $n^2 = 2k^2$ <p>which means n is an even number. Since both m and n are even, they have a common factor of 2, and this contradicts the premise that $\frac{m}{n}$ is a fraction reduced to lowest terms. $\rightarrow\leftarrow$ ■</p>	<h3>Proof by Contradiction (2)</h3> <ul style="list-style-type: none">▶ Prove the following theorem: If $x + x = x$, then $x = 0$.▶ To produce a contradiction, assume $x + x = x$ and $x \neq 0$. <table><tr><td>$x + x = x$</td><td>Premise</td></tr><tr><td>$2x = x$</td><td>Combine like terms</td></tr><tr><td>$\frac{2x}{x} = \frac{x}{x}$</td><td>Divide both sides by a non-zero number</td></tr><tr><td>$\frac{2\cancel{x}}{\cancel{x}} = \frac{\cancel{x}1}{\cancel{x}}$</td><td>Cancel equal factors</td></tr><tr><td>$2 = 1$</td><td>$\rightarrow\leftarrow$ ■</td></tr></table>	$x + x = x$	Premise	$2x = x$	Combine like terms	$\frac{2x}{x} = \frac{x}{x}$	Divide both sides by a non-zero number	$\frac{2\cancel{x}}{\cancel{x}} = \frac{\cancel{x}1}{\cancel{x}}$	Cancel equal factors	$2 = 1$	$\rightarrow\leftarrow$ ■	<h3>Mathematical Induction</h3> <ul style="list-style-type: none">▶ Some have said this is only kind of proof that computer scientists can do<ul style="list-style-type: none">▶ (This is an exaggeration)▶ Mathematical induction is valuable for proving theorems about positive integers<ul style="list-style-type: none">▶ Or just about anything that in some way ties into positive integers▶ Perhaps surprisingly, many things that computer scientists do relate somehow to the positive integers▶ A proof using mathematical induction is a two step process:<ul style="list-style-type: none">▶ basis▶ induction
$x + x = x$	Premise											
$2x = x$	Combine like terms											
$\frac{2x}{x} = \frac{x}{x}$	Divide both sides by a non-zero number											
$\frac{2\cancel{x}}{\cancel{x}} = \frac{\cancel{x}1}{\cancel{x}}$	Cancel equal factors											
$2 = 1$	$\rightarrow\leftarrow$ ■											

Mathematical Induction

- ▶ A proof using mathematical induction is a two step process:
 - ▶ basis
 - ▶ induction
- ▶ To show that property $P(n)$ is true for all positive integers:
 - ▶ Show $P(1)$; that is, show the property is true for 1 (basis)
 - ▶ Show that for an arbitrary integer k , $P(k) \rightarrow P(k+1)$ (induction)
- ▶ The basis step is almost always trivial.
- ▶ The induction step usually is more interesting

Induction Example

Prove:

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}$$

▶ **Basis** (Show $P(1)$)

$$\sum_{i=1}^1 i = 1 = \frac{2}{2} = \frac{1 \cdot 2}{2} = \frac{1(1+1)}{2}$$

▶ **Induction** (Show $P(k) \rightarrow P(k+1)$)

$$\begin{aligned} \sum_{i=1}^{k+1} i &= \sum_{i=1}^k i + \sum_{i=k+1}^{k+1} i = \sum_{i=1}^k i + (k+1) = \frac{k(k+1)}{2} + (k+1) \\ &= \frac{k(k+1)}{2} + \frac{2k}{2} + \frac{2}{2} = \frac{k(k+1) + 2k + 2}{2} \\ &= \frac{k^2 + k + 2k + 2}{2} = \frac{k^2 + 3k + 2}{2} = \frac{(k+1)(k+2)}{2} \\ &= \frac{(k+1)([k+1] + 1)}{2} \quad \blacksquare \end{aligned}$$

Non-inductive Proof

Prove:

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}$$

Let $s = \sum_{i=1}^n i$

$$\begin{aligned} s &= 1 + 2 + 3 + \dots + (n-2) + (n-1) + n \\ + s &= n + (n-1) + (n-2) + \dots + 3 + 2 + 1 \\ \hline 2s &= (n+1) + (n-1+2) + (n-2+3) + \dots + (n-2+3) + (n-1+2) + (n+1) \\ 2s &= (n+1) + (n+1) + (n+1) + \dots + (n+1) + (n+1) + (n+1) \\ \text{How many terms? } n \\ 2s &= n(n+1) \\ s &= \frac{n(n+1)}{2} \end{aligned}$$

Ladder Analogy

- ▶ The concept of mathematical induction is analogous to climbing a ladder

Ladder Analogy

- ▶ The concept of mathematical induction is analogous to climbing a ladder
- ▶ Proving the basis step indicates that you can get on the first rung of the ladder

Ladder Analogy

- ▶ The concept of mathematical induction is analogous to climbing a ladder
- ▶ Proving the basis step indicates that you can get on the first rung of the ladder
- ▶ Proving the induction step indicates that if you are on *any* rung of the ladder, you can get to the next rung of the ladder

Ladder Analogy

- ▶ The concept of mathematical induction is analogous to climbing a ladder
- ▶ Proving the basis step indicates that you can get on the first rung of the ladder
- ▶ Proving the induction step indicates that if you are on *any* rung of the ladder, you can get to the next rung of the ladder
- ▶ Together the two parts show that you climb to any rung of the ladder as high as you wish

Fence Example

- ▶ A fence is built by connecting fence segments to fence posts

- ▶ The length of a fence is determined by the number of segments it contains
- ▶ Prove that any fence built with n segments will contain $n + 1$ fenceposts.

Fence Example Proof—Basis

- ▶ **Basis**
A fence containing one segment contains two posts

- ▶ Consider a fence that contains $k + 1$ segments.

Fence Example Proof—Induction

- ▶ **Induction**
- ▶ Consider a fence that contains $k + 1$ segments.

- ▶ Embedded within a $k + 1$ long fence is a fence of length k .
- ▶ The fence of length $k + 1$ adds one segment and one fencepost to the fence of length k so the number of fenceposts in a fence of length $k + 1$ is the number of fenceposts in a fence of length k , plus one.
- ▶ By the inductive hypothesis, the number of fenceposts in the fence of length k is $k + 1$, so the number of fenceposts in the fence of length $k + 1$ is $(k + 1) + 1$. ■

Induction on Inequalities

When proving $x = y$ we use a chain of equalities beginning at x and ending at y :

$$x = \dots = y$$

Proving that $x < y$, $x \leq y$, $x > y$, or $x \geq y$ is a little different.

- ▶ For example, to show $x \leq y$, we use a chain of expressions as before, but we may use $=$ and \leq to connect the expressions.
- ▶ For example, to show $x < y$, we use a chain of expressions as before, but we may use $=$, \leq , and $<$ to connect the expressions.

Review:

- ▶ $x \leq x + a$, if $a \geq 0$
- ▶ $x < x + a$, if $a > 0$
- ▶ $x \leq ax$, if $a \geq 1$
- ▶ $x < ax$, if $a > 1$

Induction Example

Prove:

$$5n^2 + n + 10 < n^3, \text{ for all } n \geq 6$$

- ▶ **Basis** (Show $P(6)$)
 $5 \cdot 6^2 + 6 + 10 = 5 \cdot 36 + 16 = 180 + 16 = 196 < 216 = 6^3$
- ▶ **Induction** (Show $P(k) \rightarrow P(k + 1)$)

$$\begin{aligned}
 5(k + 1)^2 + (k + 1) + 10 &= 5(k^2 + 2k + 1) + k + 1 + 10 \\
 &= 5k^2 + 10k + 5 + k + 1 + 10 \\
 &= 5k^2 + k + 10 + 10k + 5 + 1 \\
 &= 5k^2 + k + 10 + 10k + 6 \\
 &< k^3 + 10k + 6 \quad (\text{Inductive hypothesis}) \\
 &\leq k^3 + 10k + k \quad (k \geq 6) \\
 &= k^3 + 11k \\
 &< k^3 + 18k
 \end{aligned}$$

<p>Induction Example <i>(continued)</i></p> <p>► Induction (Show $P(k) \rightarrow P(k+1)$)</p> $ \begin{aligned} 5(k+1)^2 + (k+1) + 10 &= 5(k^2 + 2k + 1) + k + 1 + 10 \\ &= 5k^2 + 10k + 5 + k + 1 + 10 \\ &= 5k^2 + k + 10 + 10k + 5 + 1 \\ &= 5k^2 + k + 10 + 10k + 6 \\ &< k^3 + 10k + 6 \\ &\leq k^3 + 10k + k \\ &= k^3 + 11k \\ &< k^3 + 18k \\ &= k^3 + 3 \cdot 6 \cdot k \\ &\leq k^3 + 3 \cdot k \cdot k \quad (k \geq 6) \\ &= k^3 + 3k^2 \\ &< k^3 + 3k^2 + 3k + 1 \\ &= (k+1)^3 \quad \blacksquare \end{aligned} $	<p>Quantifiers</p> <p>► Existential quantifier (\exists)</p> <ul style="list-style-type: none"> ► there exists ► $(\exists x)[P(x)]$ means there is at least one element in the set for which property P is true ► $(\exists k \in \mathbb{Z})(3k = 102)$ says that 102 is a multiple of three (true statement) ► $(\exists k \in \mathbb{Z})(3k = 100)$ says that 100 is a multiple of three (false statement) <ul style="list-style-type: none"> ► We can write $(\nexists k \in \mathbb{Z})(3k = 100)$ <p>► When the set of interest, sometimes called <i>domain of discourse</i>, is understood, we can omit the set associated with the quantifier: $(\exists k)(3k = 102)$</p>	<p>Quantifiers</p> <p>► Universal quantifier (\forall)</p> <ul style="list-style-type: none"> ► for all ► $(\forall x)[P(x)]$ means that property P is true for every element in the set ► $(\forall x \in \mathbb{R})(x^2 \geq 0)$ ► $(\forall n \in \mathbb{Z})(n + 0 = n = 0 + n)$ <p>► When the domain of discourse is understood, we can omit the set associated with the quantifier: $(\forall x)(x^2 \geq 0)$</p>
<p>Quantifiers</p> <p>► Let the universal set U be everything in the world</p> <p>► Let $P(x)$ mean “x is a parrot”</p> <p>► Let $G(x)$ mean “x is green”</p> <p>► How do we express the following? “All parrots are green”</p> <p>► $(\forall x \in U)[P(x) \wedge G(x)]$</p> <ul style="list-style-type: none"> ► “Everything in the world is a green parrot” <p>► $(\forall x \in U)[P(x) \rightarrow G(x)]$</p> <ul style="list-style-type: none"> ► “Anything that is a parrot must be green” <p>► Almost always, \rightarrow and \forall work together</p> <ul style="list-style-type: none"> ► Almost never, \wedge and \forall go together 	<p>Quantifiers</p> <p>► Let the universal set U be everything in the world</p> <p>► Let $P(x)$ mean “x is a parrot”</p> <p>► Let $G(x)$ mean “x is green”</p> <p>► How do we express the following? “There is a green parrot”</p> <p>► $(\exists x \in U)[P(x) \rightarrow G(x)]$</p> <ul style="list-style-type: none"> ► This is equivalent to $(\exists x \in U)[\neg P(x) \vee G(x)]$ ► “Something exists in the world that is not a parrot or is green” ► Because of the \vee this is true as long as you can find something (x) in the world that is not a parrot! <p>► $(\exists x \in U)[P(x) \wedge G(x)]$</p> <ul style="list-style-type: none"> ► “Something exists in the world that is both a parrot and green” <p>► Almost always, \wedge and \exists work together</p> <ul style="list-style-type: none"> ► Almost never, \rightarrow and \exists go together 	<p>Negating Quantifiers</p> <p>► $\neg\{(\forall x)[P(x)]\} \Leftrightarrow (\exists x)[\neg P(x)]$</p> <p>► Let A be the set of all animals</p> <ul style="list-style-type: none"> ► $W(x)$ means x lives in water ► $F(x)$ means x is a fish ► Is the following statement true? $(\forall x \in A)[W(x) \rightarrow F(x)]$ ► No. Consider dolphins, and other sea mammals ► The following is true: $\neg\{(\forall x \in A)[W(x) \rightarrow F(x)]\}$ $ \begin{aligned} \neg\{(\forall x \in A)[W(x) \rightarrow F(x)]\} &\Leftrightarrow (\exists x \in A)\{\neg[W(x) \rightarrow F(x)]\} \\ &\Leftrightarrow (\exists x \in A)\{\neg[\neg W(x) \vee F(x)]\} \\ &\Leftrightarrow (\exists x \in A)\{[W(x) \wedge \neg F(x)]\} \end{aligned} $

Negating Quantifiers

- ▶ $\neg\{(\exists x)[P(x)]\} \Leftrightarrow (\forall x)[\neg P(x)]$
- ▶ Let H be the set of all humans alive today
 - ▶ $T(x)$ means x is taller than six feet
 - ▶ $C(x)$ means x is less than one year old
 - ▶ Is the following statement true?
 $(\exists x \in H)[T(x) \wedge C(x)]$
 - ▶ **No.**
 - ▶ The following is true:
 $\neg\{(\exists x \in H)[T(x) \wedge C(x)]\}$

$$\neg\{(\exists x \in H)[T(x) \wedge C(x)]\} \Leftrightarrow (\forall x \in H)\{\neg[T(x) \wedge C(x)]\}$$
$$\Leftrightarrow (\forall x \in H)[\neg T(x) \vee \neg C(x)]$$
$$\Leftrightarrow (\forall x \in H)[T(x) \rightarrow \neg C(x)]$$

Multiple Quantifiers

- ▶ Multiple variables require multiple qualifiers
 - ▶ $P(x,y)$ could mean $x^2 - y^2 = (x+y)(x-y)$
 - ▶ This is true for all real numbers x and y
 $(\forall x \in \mathbb{R})(\forall y \in \mathbb{R})[x^2 - y^2 = (x+y)(x-y)]$
- ▶ You may arrange multiple universal quantifiers in any order without changing the logical meaning:
 - ▶ $(\forall x)(\forall y)[P(x,y)] \Leftrightarrow (\forall y)(\forall x)[P(x,y)]$
- ▶ $P(x,y)$ could mean $x + y = 4$ and $x - y = 2$
 - ▶ This is true for only two real numbers, $x = 3$ and $y = 1$
 - ▶ $(\exists x \in \mathbb{R})(\exists y \in \mathbb{R})[(x + y = 4) \wedge (x - y = 2)]$
- ▶ You may arrange multiple existential quantifiers in any order without changing the logical meaning:
 - ▶ $(\exists x)(\exists y)[P(x,y)] \Leftrightarrow (\exists y)(\exists x)[P(x,y)]$

Mixing Universal and Existential Quantifiers

- ▶ Order matters
- ▶ Consider the set P consisting of all the people in the world. Let $\text{likes}(x,y)$ mean “ x likes y .” Interpret each of the following statements:
 - ▶ $(\forall x \in P)(\exists y \in P)[\text{likes}(x,y)]$
▶ “Everyone likes somebody”
 - ▶ $(\exists y \in P)(\forall x \in P)[\text{likes}(x,y)]$
▶ “There is somebody that everyone likes”
 - ▶ These are not the same
 - ▶ $(\exists x \in P)(\forall y \in P)[\text{likes}(x,y)]$
▶ “There is somebody that likes everyone”
- ▶ $(\forall x \in \mathbb{Z})(\exists y \in \mathbb{Z})(x + y = 0 = y + x)$
 - ▶ For every integer (x) you can find an integer (y) such that the sum of the two is zero ($x + y = 0$).
 - ▶ Every integer has an additive inverse: $x + (-x) = 0 = (-x) + x$
- ▶ $(\exists y \in \mathbb{Z})(\forall x \in \mathbb{Z})(x + y = 0 = y + x)$
 - ▶ There is an integer (y) that may be added to any integer (x) to produce zero.
 - ▶ There is no such integer that works for any integer

Proof Methods

- ▶ Theorems in mathematics are expressed in one of two ways:
 - ▶ If P , then C $P \Rightarrow C$
 - ▶ P if and only if C $P \Leftrightarrow C$
 - ▶ In order to prove $P \Leftrightarrow C$, we must prove $(P \Rightarrow C) \wedge (C \Rightarrow P)$
- ▶ Ways to prove $P \Rightarrow C$:
 - ▶ **Direct:** Assume P is true and deduce C
 - ▶ **Indirect (proof by contradiction):** Assume P is true and C is false and derive a contradiction to a premise, theorem, or other basic concept

Exhaustive Proof

- ▶ If the theorem involves a small, finite number of cases, an exhaustive proof may be possible
 - ▶ Demonstrate the theorem’s correctness in all possible cases
- ▶ Prove: $(\forall m \in \mathbb{N})(\forall n \in \mathbb{N})[(m < 4 \wedge n < 4) \rightarrow (m \cdot n < 10)]$
 - ▶ Build a multiplication table

·	0	1	2	3
0	0	0	0	0
1	0	1	2	3
2	0	2	4	6
3	0	3	6	9

- ▶ Most interesting theorems deal with properties of infinite sets like \mathbb{N} , \mathbb{Z} , and \mathbb{R}

Examples and Counterexamples

- ▶ Unless an exhaustive enumeration of all the cases is possible, “proof by example” is **not** a proof!
 - ▶ Prove: The sum of two integers equals the product of those two integers
 - ▶ Example: $2 + 2 = 4 = 2 \cdot 2$; therefore, the sum of two integers equals the product of those integers
 - ▶ Is this true in general?
 - ▶ No. $2 + 3 = 5 \neq 6 = 2 \cdot 3$
- ▶ We cannot use an example to *prove* a theorem, but we use an example to *disprove* a proposed theorem
- ▶ An example that disproves a proposed theorem is called a *counterexample*
- ▶ A counterexample is an easy way to disprove a theorem, but a counterexample may not always be easy to find

Examples and Counterexmples

- ▶ Examples provide evidence that a theorem may be true
- ▶ Examples may suggest a strategy for constructing a proof, but do not constitute a proof
- ▶ Prove or disprove that all numbers in the sequence 12, 121, 1211, 12111, 121111, 1211111, ... are composite
 - ▶ A composite number has factors (divisors) other than 1 and itself
 - ▶ Try some examples and perhaps find a quick counterexample:

1	12	3 · 4
2	121	11 · 11
3	1211	7 · 173
4	12111	3 · 4,037
5	121111	281 · 431
6	1211111	11 · 110,101
7	12111111	3 · 4,037,037
8	121111111	11 · 11,010,101
9	1211111111	7 · 173,015,873
10	12111111111	3 · 4,037,037,037
 - ▶ Looking good!

Examples and Counterexmples

- ▶ Prove or disprove that all numbers in the sequence 12, 121, 1211, 12111, ... are composite
 - ▶ Try some examples:

1	12	3 · 4
2	121	11 · 11
3	1211	7 · 173
4	12111	3 · 4,037
5	121111	281 · 431
6	1211111	11 · 110,101
7	12111111	3 · 4,037,037
8	121111111	11 · 11,010,101
9	1211111111	7 · 173,015,873
10	12111111111	3 · 4,037,037,037
 - ▶ Write a computer program to check
 - ▶ But ...

$$\underbrace{12111 \dots 111}_{138 \text{ digits}}$$

is a prime number (not composite)
